

Learning Data Wrangling with AI

Rojesh Shikhrakar • 27 Apr

In this program we'll be using popular AI tools for learning.

- Interact with Gemini Gem - It will simulate real-world scenarios and challenge you with advanced questions relevant to cleaning, reshaping, and preparing data. If you get stuck, don't worry—ask for help and Gemini will guide you step by step, showing you how to solve the problem while explaining the reasoning behind each step. This way, you'll not only complete the task but also build a deeper understanding of practical data wrangling techniques.
- Use NotebookLM to learn from multiple sources. Course notes, books, research papers, articles, guides, videos, etc will be preloaded for you to ask **targeted questions**, create **summaries**, or to test yourself or request of complex processes. We have already generated certain contents and quizzes to help you learn certain topics and ideas faster. But do ask questions to the NotebookLM to learn more. Here are some questions to get started :
 - When should I choose SQL over pandas ?
 - What is "Tidy Data," and why is it the preferred structure for analysis?
 - What is long form vs wide form table ?
 - What is the difference between data "integrity" and data "fit"?
 - How can I use "deductive imputation" to handle missing values?
