Week3_Problem_Set_GenAI

Prabhat Ale • 01:21

Assignments • 100 points

Due 20 May

This assignment consists of four interconnected tasks that must be completed sequentially in the given order:
Task 1
Task 2
Task 3
Task 4

Each task builds upon the previous one, so it is important to complete them step-by-step rather than independently.

You are expected to reuse the PostgreSQL database and dataset that were used in the previous sessions and assignments. The same schema, tables, and seeded data should remain the foundation for this project.

For implementation, you may:

- continue working in the same repository,
- create a new repository,
- or organize the work inside a separate project folder/module.

However, the existing database setup and dataset must still be used for all tasks in this assignment.

The goal is to progressively build a complete Text-to-SQL and agentic query execution system on top of the database infrastructure you have already developed earlier in the course.
